

Ans to the Question 1 (a)

1(a)

Quiz-5

1

Date : .....

$$y = f(w, \phi(n)) = \sigma \left( \begin{matrix} w_{13}^{(2)\top} \phi_3 + w_{12}^{(2)\top} \phi_2 + w_{11}^{(2)\top} \phi_1 + b_{21} \end{matrix} \right)$$

↓  
softmax

Ans to the Question 1 (b)

1(b)

$$y(n) = f(w, \phi(n))$$

$$= \sigma \left( \overset{2(T)}{w_{02}} \phi_3 + \overset{2(T)}{w_{01}} \phi_2 + \overset{2(T)}{w_{00}} \phi_1 + b_{00} \right)$$

→ softmax function.

$$\begin{aligned} \phi_1 = \phi_1(n) &= h \left( \overset{1(T)}{w_{10}} x_0 + \overset{1(T)}{w_{11}} x_1 + \overset{1(T)}{w_{12}} x_2 \right. \\ &\quad \left. + \overset{1(T)}{w_{13}} x_3 + \overset{1(T)}{w_{14}} x_4 + b_{11} \right) \\ &= h \left( \overset{1(T)}{w_1^T} x + b_{11} \right) \end{aligned}$$

where  $h$  is the non-linear function

that is applied to the linear

transform  $w^T x = (w) \phi(w) = y$

$$\phi_2 = \phi_2(n) = h \left( \overset{2(T)}{w_2^T} x + b_{22} \right)$$

$$\phi_3 = \phi_3(n) = h \left( \overset{2(T)}{w_3^T} x + b_{13} \right)$$

3

\* The non-linearity / non-linear function is applied to learn the non-linear relations in the data. Different functions: Relu, Gelu, Sigmoid. etc.

\* Role of  $\Phi$ : There are called <sup>neurons of</sup> hidden units. Each neuron learns a different feature or relation in the data. At the end the <sup>final</sup> output is the ~~different~~ scaled/weighted function of the output of different neurons. where the input to each of the neuron is the scaled / weighted <sup>version</sup> ~~function~~ of each input.
